FatPipe launches multi-line WAN for Inmarsat FleetBroadband

Friday 26 July 2013 | 20:18 CET | News

FatPipe Networks has launched a new multi-line WAN optimisation and link redundancy services for Inmarsat FleetBroadband users and partners. FleetBroadband users can now increase the efficiency of their satellite network and gain better control of how it is used whilst adding a high level of redundancy and availability for fault tolerant networks. Inmarsat partners will now be able to deploy FatPipe product to solve their customers' network and bandwidth congestion issues. FatPipe's services for WANs provide redundancy, back up and high availability by allowing consumers to utilise multiple satellite connections, and when available, landlines, 3G/4G and wireless. FatPipe's products work with multiple data and networks connections, providing the bandwidth capacity for critical applications. All sessions are failed over from one line to another, when one of the lines goes down.
